Note: Specification may be changed without further notice.
1 FEATURES

1.1 I•CODE SLI RF Interface (ISO 15693)

- Contactless transmission of data and supply energy (no battery needed)
- Operating distance: Up to 1.5m (depending on antenna geometry)
- Operating frequency: 13.56 MHz (ISM, world wide licence free available)
- Fast data transfer: up to 53 kbit/s
- High data integrity: 16 Bit CRC, framing
- True anticollision
- Electronic Article Surveillance (EAS)
- Application Family Identifier (AFI) supported
- Data Storage Format Identifier (DSFID)
- Additional fast anticollision read
- Write distance equal to read distance

1.2 EEPROM

- 896 bits for user data, organised in 28 blocks of 4 byte each
- User definable access conditions for memory blocks 0 to 27
- Data retention of 10 years.
- Write endurance 100,000 cycles

1.3 Security

- Unique identifier for each device
- Lock mechanism for each block (write protection)
- Lock mechanism for DSFID, AFI, EAS

I•CODE® is a registered trademark of Philips Electronics N.V.
2 GENERAL DESCRIPTION

The I•CODE SLI IC is a dedicated chip for intelligent label like supply chain management as well as baggage and parcel identification in airline business and mail services. This IC is the first member of a product family of smart label ICs based on the ISO standard ISO 15693.

The I•CODE system offers the possibility of operating labels simultaneously in the field of the reader antenna (Anticollision). It is designed for long range applications.

2.1 Contactless Energy and Data Transfer

Whenever connected to a very simple and cheap type of antenna (as a result of the 13.56 MHz carrier frequency) made out of a few windings printed, winded, etched or punched coil the I•CODE SLI IC can be operated without line of sight up to a distance of 1.5 m (gate width). No battery is needed. When the smart label is positioned in the field of an interrogator antenna, the high speed RF communication interface allows to transmit data with up to 53 kbit/s.

2.2 Anticollision

An intelligent anticollision function allows to operate more than one tag in the field simultaneously. The anticollision algorithm selects each tag individually and ensures that the execution of a transaction with a selected tag is performed correctly without data corruption resulting from other tags in the field.

2.3 Security

Unique Identifier, which can not be altered, guarantee the uniqueness of each label
The label requires no internal power supply. Its contactless interface generates the power supply and the system clock via the resonant circuitry by inductive coupling to the interrogator. The interface also demodulates data that are transmitted from the interrogator to the I•CODE Label, and modulates the electromagnetic field for data transmission from the I•CODE Label to the interrogator.
3.2 Memory Organisation

The 896 bit EEPROM user memory is divided into 28 blocks. A block is the smallest access unit. Each block consists of 4 bytes (1 block = 32 bits). Bit 0 in each byte represents the least significant bit (LSB) and bit 7 the most significant bit (MSB), respectively.

The contents of the blocks are not defined at delivery.

All blocks can be addressed by read and write commands.

3.2.1 CONFIGURATION OF DELIVERED ICS

I•CODE SLI ICs are delivered with the following configuration by Philips:

- Unique Identifier is unique and read only
- Write Access Conditions allow to change all blocks (with the exception of both UID blocks).
- Status of EAS mode is not defined
- AFI is supported and not defined
- DSFID is supported and not defined
- User Data memory is not defined

3.2.2 UNIQUE IDENTIFIER

The 64 bit unique identifier (UID) is programmed during the production process according to ISO/IEC 15693-3 and cannot be changed afterwards.

The numbering of the 64 bits is done according to ISO/IEC 15693-3 starting with the LSB 1 and ending with the MSB 64. This is in contrast to the general used bit numbering within a byte.

The TAG type is a part of the UID (bit41 to 48, after the manufacturer code which is “04” hex for Philips Semiconductors).

The TAG type of the SL2 ICS20 is “01” hex.

3.2.3 APPLICATION FAMILY IDENTIFIER

The I•CODE system offers the feature to use an Application Family Identifier (AFI) at the inventory command and the two custom commands inventory read and fast inventory read (this allows for example the creation of 'label families').

For details please refer to ISO 15693-3.
Write Access Conditions
Each block in the user memory can be individually write protected (please see 3.4.2.3). Write protected blocks can never be written to from this moment on.

3.3 Communication Principle
For detailed description of the protocol and timing please refer to ISO 15693-2 (modulation, bit-coding, framing) and 15693-3 (anticollision, timing, protocol).

3.4 Supported commands

3.4.1 MANDATORY COMMANDS
3.4.1.1 Inventory
As defined in ISO/IEC 15693-3.

3.4.1.2 Stay quiet
As defined in ISO/IEC 15693-3.

3.4.2 OPTIONAL COMMANDS
3.4.2.1 Read single block
As defined in ISO/IEC 15693-3.
Option 0 (option flag not set) is supported.
Option 1 (option flag set) is supported.

3.4.2.2 Write single block
As defined in ISO/IEC 15693-3.
Only Option 0 (option flag is not set) is supported.

3.4.2.3 Lock block
As defined in ISO/IEC 15693-3.
Only Option 0 (option flag is not set) is supported.
3.4.2.4 Read multiple blocks

As defined in ISO/IEC 15693-3.
Option 0 (option flag is not set) is supported.
Option 1 (option flag set) is supported.

Note: If the sum of first block number and number of blocks exceeds the total available number of user blocks the number of transmitted blocks is less than the requested number of blocks, which means that the last returned block is the highest available user block, followed by the 16 bit CRC and the EOF.

3.4.2.5 Select

As defined in ISO/IEC 15693-3.

3.4.2.6 Reset to ready

As defined in ISO/IEC 15693-3.

3.4.2.7 Write AFI

As defined in ISO/IEC 15693-3.
Only Option 0 (option flag is not set) is supported.

3.4.2.8 Lock AFI

As defined in ISO/IEC 15693-3.
Only Option 0 (option flag is not set) is supported.

3.4.2.9 Write DSFID

As defined in ISO/IEC 15693-3.
Only Option 0 (option flag is not set) is supported.

3.4.2.10 Lock DSFID

As defined in ISO/IEC 15693-3.
Only Option 0 (option flag is not set) is supported.
3.4.2.11 Get system information

As defined in ISO/IEC 15693-3.

The TAG type of the SL2 ICS20 is "01" hex.

3.4.2.12 Get multiple block security status

As defined in ISO/IEC 15693-3.

Note: If the sum of first block number and number of blocks exceeds the total available number of user blocks, the number of transmitted security status bytes is less than the requested number, which means that the last returned status byte is the one corresponding to the highest available user block, followed by the 16 bit CRC and the EOF.
3.4.3 CUSTOM SPECIFIC COMMANDS

The manufacturer code of Philips is defined in ISO 7816-6A1. It has the value of 04hex.
For the structure of custom specific commands please refer to 15693-3.

3.4.3.1 Inventory read

Command Code = A0 hex

When receiving the inventory read request, the I•CODE SLI IC performs the same as in the anti-collision sequence, with the difference that instead of the UID and the DSFID the requested memory content is re-transmitted from the I•CODE SLI IC.

If an error is detected the I•CODE SLI IC remains silent.

If the option flag is set to 0 n blocks of data are re-transmitted. If the option flag is set to 1 n blocks of data and the part of the UID which is not part of the mask and slot number are re-transmitted.

The request contains:
- Flags
- Inventory read command code
- IC Manufacturer code ("04" hex)
- AFI (if the AFI flag is set)
- Mask length
- Mask value (if mask length >0)
- First block number to be read
- Number of blocks to be read
- CRC 16

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>Inventory Read</th>
<th>IC Mfg. code</th>
<th>Optional AFI</th>
<th>Mask Length</th>
<th>Mask Value</th>
<th>First block number</th>
<th>Number of blocks</th>
<th>CRC 16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>8 bits</td>
<td>8 bits</td>
<td>8 bits</td>
<td>8 bits</td>
<td>0 – 64 bits</td>
<td>8 bits</td>
<td>8 bits</td>
<td>8 bits</td>
<td>16 bits</td>
<td></td>
</tr>
</tbody>
</table>

The Inventory_flag must be set to 1.

The meaning of flags 5 to 8 is according to table 5 in ISO/IEC 15693-3.

The number of blocks in the request is one less than the number of blocks that the I•CODE SLI IC returns in its response.
If the Option flag in the request is set to 0 the response contains:

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>Data</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>0x0</td>
<td>Block Length</td>
<td>16 bits</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Repeated as needed</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The I•CODE SLI IC reads the requested block(s) and sends back their value in the response. The mechanism and timing of the Inventory read command performs the same as at the Inventory command which is described in Clause 8 of ISO/IEC 15693-3.

If the Option flag in the request is set to 1 the response contains:

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>Rest of UID which is not part of the mask and slot number</th>
<th>Data</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>0x0</td>
<td>0 to 64 bit</td>
<td>Block Length</td>
<td>16 bits</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Multiple of 8 bits</td>
<td>Repeated as needed</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The I•CODE SLI IC reads the requested block(s) and sends back their value in the response. Additionally the bytes of the UID, which are not parts of the mask and the slot number in case of 16 slots, are returned. Instead of a padding with zeros up to the next byte boundary the corresponding bits of the UID are returned. The mechanism and timing of the Inventory read command perform the same as at the Inventory command which is described in Clause 8 of ISO/IEC 15693-3.

Note: The number of bits of the re-transmitted UID can be calculated as follows:

16 slots: \(64 - 4 - \text{mask length rounded up to the next byte boundary}\)

1 slot: \(64 - \text{mask length rounded up to the next byte boundary}\)

Note: If the sum of first block number and number of blocks exceeds the total available number of user blocks the number of transmitted blocks is less than the requested number of blocks, which means that the last returned block is the highest available user block, followed by the 16 bit CRC and the EOF.
Example: mask length=30
Returned: 64-4-30=30 gives 4 bytes

<table>
<thead>
<tr>
<th>Byte0</th>
<th>Byte1</th>
<th>Byte2</th>
<th>Byte3</th>
<th>Byte4</th>
<th>Byte5</th>
<th>Byte6</th>
<th>Byte7</th>
<th>UID</th>
</tr>
</thead>
<tbody>
<tr>
<td>mask value incl. padding with zeros</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>transmitted by Interrogator</td>
</tr>
<tr>
<td>returned value</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>transmitted by CODE SLI IC</td>
</tr>
</tbody>
</table>

3.4.3.2 Fast inventory read

Command Code = A1 hex

When receiving the fast inventory read command the CODE SLI IC behaves the same as in the inventory read command with the following exceptions:

The datarate in the direction CODE SLI IC to the interrogator is twice as defined in ISO/IEC 15693-3 (depending on the datarate_flag 53 kbit/s (high datarate) or 13 kbit/s (low datarate)).

The datarate from the interrogator to the CODE SLI IC and the time between the rising edge of the EOF from the interrogator to the response of CODE SLI IC remain unchanged (stay the same as defined in ISO/IEC 15693-3).

In the direction CODE SLI IC to the interrogator only the single subcarrier mode is supported.
3.4.3.3 Set EAS

Command Code = A2 hex

This command sets the EAS bit to 1.

Request format

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>Set EAS</th>
<th>IC Mfg. code</th>
<th>UID</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>8 bits</td>
<td>8 bits</td>
<td>64 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Response format when Error_flag is set

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>Error Code</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>8 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Response format when Error_flag is NOT set

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3.4.3.4 Reset EAS

This command sets the EAS bit to 0.

Command Code = A3 hex

Request format

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>Reset EAS</th>
<th>IC Mfg. code</th>
<th>UID</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>8 bits</td>
<td>8 bits</td>
<td>64 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Response format when Error_flag is set

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>Error Code</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>8 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Response format when Error_flag is NOT set

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
3.4.3.5 Lock EAS

**Command Code = A4 hex**

This command locks the current state of the EAS bit.

Request format

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>Lock EAS</th>
<th>IC Mfg. code</th>
<th>UID</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>8 bits</td>
<td>8 bits</td>
<td>64 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Response format when Error_flag is set

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>Error Code</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>8 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Response format when Error_flag is NOT set

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3.4.3.6 EAS Alarm

**Command Code = A5 hex**

If the EAS bit is set to 1 the EAS response is returned from the *CODE SLI IC

Request format

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>EAS</th>
<th>IC Mfg. code</th>
<th>UID</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>8 bits</td>
<td>8 bits</td>
<td>64 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If an error is detected the *CODE SLI IC remains silent

Response format

<table>
<thead>
<tr>
<th>SOF</th>
<th>Flags</th>
<th>EAS sequence</th>
<th>CRC16</th>
<th>EOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>256 bits</td>
<td>16 bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
EAS sequence (starting with the LSB, which is transmitted first; read from left to right):

```
11110100 11001101 01000110 00001110 10101011 11100101 00001001 11111110
00010111 10001101 00000001 00011100 01001011 10000001 10010010 01101110
01000001 01011011 01011001 01100001 11110110 11110101 11010001 00001101
1001111 00111001 10001011 01001000 10100101 01001110 11101100 11110111
```

If the EAS bit is set to 0 the I•CODE SLI IC remains silent.

### 3.5 Data Integrity

Following mechanisms are implemented in the contactless communication link between interrogator and label to ensure very reliable data transmission:

- 16 bit CRC per block
- Bit count checking
- Bit coding to distinguish between "1", "0", and no information
- Channel monitoring (protocol sequence and bit stream analysis)

### 3.6 RF Interface

The definition of the RF-interface is according to the standard ISO/IEC 15693-2 and ISO/IEC 15693-3.
